Tormek Water Trough for T-8-

Overview and features

Water Trough Magnet

The water trough incorporates a strong magnet which attracts the steel particles ground from the tools being sharpened. This keeps your stone clean and cutting more freely. These small steel particles are otherwise pressed into the stone surface and can disturb the sharpening.

The steel particles are all collected at the magnet when you empty the water trough. You can easily scrape off the steel particles using the scraper that attaches magnetically to the outside of the water trough.

* The magnetic scraper is not included in the R-3090 Water Trough for T-8, so make sure to keep the scraper from your previous water trough.

Efficient water cooling.

One of the foundations of the Tormek sharpening system is water cooling, which both keeps temperatures down so as not to damage tempering, and removes sharpening dust and steel particles from the sharpening process. It's unusual, but the water trough on the Tormek T-8 can be damaged. In that case, you can easily order a new one that's ready to be mounted and filled with water so that you can start sharpening with water cooling again!
